

Safe for water?

Blowpack, a division of Polyoak Packaging manufactures a range of 10L, 20L and 25L drums.

Most are supplied to the chemical industry, some to contain hazardous materials.

The drums consist of food grade plastic (HDPE) and are manufactured in compliance with the highest food safety standards, making them completely safe for water.

This includes Blowpack's drums which bear the embossed mark "Do Not Use For Water", provided they have been purchased new.

Any container which has previously contained hazardous chemicals is never safe for water containment.

Blowpack added the indelible warning to its drums to mitigate the risk of drums previously containing chemicals, being repurposed for water containment. This is also in line with the Consumer Protection Act.

Where customers guarantee that the drums are being used to contain food or beverages (such as water), Blowpack is able to supply the drums without the warning mark.

However due to the significant sales demand recently, Blowpack has run out of the unmarked version.

Therefore we have made the marked version available, which is safe for water containment."
